

Nitritty LABS

NeuralCam

NeuralCam by Nitritty Labs enables fully or partially immobile patients to call for help with a simple eye blink.

Patients previously reliant on regular rounds can now request assistance at any time. The technology is welcomed not only by hospitals and rehab centers, but also by nursing homes.

NeuralCam helps prevent dangerous situations where a patient cannot call for assistance due to paralysis or limited limb mobility, and it also supports patients with voice limitations.

Reliable eye recognition in all lighting conditions, including darkness. Video is processed directly on the camera - no transmission, storage, or sharing of data, and thus ensuring complete patient privacy. This approach minimizes risks and is fully GDPR-compliant.

Reliable in all lighting conditions

Works with patient call systems

Full patient privacy ensured

Fast installation and commissioning

Traffic-light feedback indicating blink status to the patient
